COMODO
Secure Shopping

✓ What is "Secure Shopping" ?

Comodo Internet Security with its new Secure Shopping feature will provide our users the most secure environment to shop and bank online . CIS Secure Shopping feature provides a total protection within the secure environment for keylogger, ssl sniffing, memory scraping and remote control. It protects your banking transactions, credit card numbers and other sensitive personal data you have .

✓ How Does it Works ?

Running Secure Shopping tool will create a secure environment for user to browse. The secure environment can be a separate virtual desktop(Desktop isolation) or still running on Windows desktop with a secure browser, which depends on the CIS settings. In the separate virtual desktop, user is able to launch one of the four browser, Comodo Dragon,Chromodo, Comodo Ice Dragon, Internet Explorer, Firefox and Chrome from the start menu. However, they should be already installed in user's current Windows system. If no isolated desktop used, in the Windows desktop, a blue frame will be used to mark secure window around the browser.

On CIS Secure Shopping Settings menu, user is able to save a shopping / banking website into the database and create a rule. So that when the user attempts to open this website user has the option to:

Always visit with secure browser.

Always visit in secure shopping environment.

See the suggestion to visit with secure browser, in secure shopping environment or to proceed with current unsecured browser.

✓ What we do , What others do ?
